RUVEXI

SALON MANAGEMENT SAAS
PRODUCT REQUIREMENTS DOCUMENT

The operating system for modern salons.

A product specification for a multi-tenant salon platform covering daily operations, branded booking websites, customer relationships, POS, staff, WhatsApp, analytics, AI, security and the roadmap to 50+ salons.

DOCUMENT	DETAIL
Version	1.0
Prepared	October 2026
Market	India-first; extensible internationally
Initial scale target	1–50 salons on one shared platform
Status	Product specification / implementation baseline

BRAND DIRECTION

Primary blue #2563EB • Deep navy #0F172A • Accent purple #8B5CF6 • White/light neutral surfaces

Brand status: RUVEXI is the selected working name. Trademark clearance and registration are not yet confirmed.

- 9. Product roadmap
- 10. Non-functional requirements
- 11. Testing and acceptance criteria
- 12. Success metrics
- 13. Scaling to 50 salons
- 14. MVP definition of done

1. Product overview and goals

1.1 Problem statement

Salon owners often split appointments, customer details, billing, staff scheduling, marketing and reporting across notebooks, spreadsheets, messaging apps and separate tools. RUVEXI brings these workflows into one connected system.

1.2 Product vision

One platform for salons to manage operations, build their own digital presence, retain customers, and grow revenue.

1.3 Objectives

- Give each salon its own branded digital presence.
- Manage daily operations from one owner dashboard.
- Enable online bookings without requiring customers to install an app.
- Connect bookings, customer history, checkout, staff performance and reporting.
- Automate confirmations, reminders and customer-retention follow-ups.
- Provide actionable business insights based on real data.
- Support one salon today and multiple branches later.
- Operate all salons on one secure, scalable platform.

1.4 Non-goals for the initial release

- A public marketplace where all salons compete for customers.
- A complete accounting or payroll compliance suite.
- Acting as a payment service provider.
- Building a custom mobile app for every salon.
- Maintaining separate codebases or databases per salon.
- Launching advanced AI before core workflows are reliable.

2. Users, roles and access control

Role	Primary responsibilities
RUVEXI Super Admin	Tenant lifecycle, subscriptions, platform health, usage, support and feature flags.
Salon Owner	Business configuration, bookings, CRM, billing, staff, branding, reports, integrations and subscription.
Salon Manager	Daily operations, appointments, staff scheduling and scoped reporting.
Receptionist	Bookings, walk-ins, customer lookup, checkout and reminders, as permitted.
Salon Staff	Assigned appointments, personal schedule, attendance and allowed performance information.
Customer	Browse a salon website, book services, receive updates and manage eligible bookings.

2.1 Role-based access control

Permissions must be configurable within the platform's role model. Navigation is permission-aware. Owners have full access to their salon; managers, receptionists and staff receive only the access required for their duties.

Capability	Owner	Manager	Receptionist	Staff
Dashboard	Full	Scoped	Daily ops	Personal
Appointments	Full	Manage	Manage	Assigned
Customer CRM	Full	Manage	Limited	Limited

Capability	Owner	Manager	Receptionist	Staff
POS / billing	Full	Manage	Checkout	Optional
Staff management	Full	Manage	View schedule	Own profile
Branding / integrations	Full	Optional	No	No
Reports	Full	Scoped	Limited	Personal
Subscription	Full	No	No	No

3. Product surfaces

Surface	Description	Delivery
Owner dashboard	Operations, CRM, POS, analytics, branding and settings.	Web MVP
Branded salon website	Services, staff, offers, booking, contact and policies.	Web MVP
Customer booking	Responsive booking, confirmation and eligible booking management.	Web / PWA
Super-admin console	Tenants, subscriptions, support, usage and health.	Protected web area
Staff mobile experience	Schedule, appointments, attendance and profile.	Later Flutter phase
Dedicated customer app	Optional repeat-customer and loyalty app.	After validation

3.1 Owner navigation

- Overview; Appointments; Calendar; Customers; Services & Categories; Staff.
- Billing & POS; Inventory; Memberships & Loyalty; Marketing & WhatsApp.
- Reports & Analytics; AI Business Insights; Website & Branding; Integrations.
- Settings; Subscription & Billing.

Navigation must adapt to permissions and subscription entitlements. Do not show active-looking controls for unavailable features.

4. Functional requirements

4.1 Owner dashboard

- Show today's appointments, booking statuses, revenue and payment breakdown.
- Show completed, pending, cancelled and no-show appointments.
- Show new/returning customers, staff availability and service performance.
- Surface outstanding payments, low stock, expiring memberships and follow-up opportunities.
- Support date, branch, staff and service filters where relevant.
- Clicking a metric opens the corresponding filtered list.
- Use persisted records only; never silently substitute fabricated values when APIs fail.

4.2 Appointment management

Booking fields

- Customer or walk-in record; one or more services; staff preference or automatic assignment.
- Date, start time, service duration, buffer time, price, deposit and notes.
- Booking source, confirmation state and communication preferences.

Calendar and lifecycle

- Day, week, staff-column and list views, with a mobile agenda.
- Lifecycle: Requested → Confirmed → Checked In → In Service → Completed.

- Alternative outcomes: Cancelled, No-show, Rescheduled and optional Rejected.
- Record status changes, timestamps and acting user.

Scheduling rules

- Prevent overlapping bookings for the same staff member.
- Respect working hours, breaks, holidays, leave, duration and buffer time.
- Support walk-ins, staff-created bookings, cancellation policies and optional deposits.
- Handle concurrent booking attempts safely; do not confirm the same slot twice.
- Store times consistently and display them in the salon's configured timezone.

Acceptance criterion: two customers attempting to book the same unavailable staff/time slot cannot both receive confirmed bookings.

4.3 Branded customer booking website

- Sections: salon introduction, services/prices, staff, offers/packages, gallery, booking, location/hours, contact, WhatsApp, policies/FAQs and confirmation.
- Owner controls: salon name, logo, favicon, colors, cover, gallery, about text, address, contacts and social links.
- Configure services, staff profiles, hours, booking policies, promotional banners, SEO title/description and social preview image.
- Responsive, accessible, fast-loading and search-engine-friendly pages with clear error states.
- Subdomains may map to tenant records; check actual domain availability. Custom domains can be a later paid feature.

4.4 Branding editor

- Live preview; logo upload/cropping; color picker and presets.
- Banner/gallery upload; editable website sections; desktop/mobile preview.
- Publish/unpublish, validation and restore a prior published configuration.
- Branding is data-driven. Do not create a separate codebase for every salon.

4.5 Customer CRM

- Profile: name, phone, optional email/birthday, consent and communication preferences.
- First/last visit, appointments, invoices, total spend, average ticket and preferred staff.
- Favorite services, memberships, loyalty points, notes and tags.
- Search by name/phone; filter by recency, spending and customer status.
- Duplicate merge workflow; authorized CSV export; lawful deletion/anonymization workflow.
- Marketing eligibility must respect consent and opt-outs.

Acceptance criterion: customer history updates from persisted bookings, completed appointments and payments.

4.6 Services and pricing

- Manage categories, descriptions, duration, buffer time and standard price.
- Configure tax settings, staff eligibility, staff-specific prices and branch availability.
- Set online visibility, active/inactive state, add-ons, packages and combinations.
- Historical invoices must not change silently when a service price is edited.

4.7 Staff management

- Profiles, contact details, photo, role, permissions, specialties and assigned services.
- Branch assignment, working schedule, leave, attendance and active status.
- Daily schedule, appointment completion, commission rules and performance reports.
- Optional shift management, leave approvals and staff-specific booking links.
- Commission calculations must be traceable to eligible completed invoice items; estimates are not payroll finalization.

4.8 Billing and POS

Checkout workflow

- Open completed appointment or create walk-in bill; add services/products.
- Apply eligible discounts, package credits and taxes; record payment and split payments if enabled.
- Issue invoice/receipt; update customer history and eligible inventory/commission.
- Trigger receipt and follow-up workflows according to salon settings.

Payment and financial controls

- Support cash, UPI, card/external terminal, gateway, bank transfer, advances and split payments.
- Invoice includes salon details, unique number, date, line items, discounts, taxes, payment status and balance.
- Recording a payment method is not proof a gateway payment succeeded; verify provider events.
- Do not hard-delete finalized invoices or settled payments; use voids, credit notes and adjustments as appropriate.
- Maintain payment/refund audit trails, verify webhooks and reconcile gateway transactions idempotently.
- Review GST/tax behavior against the salon's registration and applicable rules before launch.

4.9 Inventory

- Product catalogue, SKU/barcode, category, cost/selling price and current stock.
- Minimum stock thresholds, suppliers, stock adjustments and stock movement ledger.
- Deduct retail sales from stock; low-stock alerts and inventory valuation reports.
- Later: purchase orders, supplier invoices, branch transfers, lot/expiry tracking and service-product usage.
- Every stock change records a reason, user and timestamp.

4.10 Memberships, packages and loyalty

- Loyalty points, earning/redemption rules, membership plans and prepaid packages.
- Session packages, gift cards, coupons, discounts, expiry and redemption history.
- Prevent duplicate redemption and overspending; reverse balances correctly on refunds/cancellations.

4.11 WhatsApp and notifications

- Connect each salon's eligible business identity through official WhatsApp Business Platform onboarding.
- Booking confirmations, reminders, cancellations, rescheduling, receipts, payment confirmations and rebooking reminders.
- Membership expiry notices and promotional campaigns only with appropriate permission.
- Owner settings for connection, approved templates, timing, delivery status, usage and cost.
- Respect template, messaging-window, consent and opt-out requirements.
- Isolate salon credentials, secure tokens, track provider errors and retry idempotently.
- Show billable usage and who bears the cost; SMS/email/push may be alternatives.

4.12 Reports and analytics

Report	Core dimensions
Revenue	Date, branch, payment method; distinguish gross, discounts, taxes, refunds and net.
Appointments	Volume, status, cancellations and no-show rates.
Services	Service sales and category performance.
Staff	Revenue, completed services and commission summaries.
Customers	New/returning, average ticket, retention and visit recency.
Finance	Outstanding balances and payment breakdown.
Inventory	Product sales, stock movement and valuation.
Memberships	Sales, redemptions, expiry and remaining sessions.

- Provide date filters, authorized exports and consistent metric definitions.
- Reports must reconcile with underlying transactions.

4.13 AI Business Insights

- Phase 1: overdue-visit signals, cancellation patterns, underbooked periods, demand trends, low-stock warnings and prior-period revenue comparisons.
- Phase 2: natural-language performance questions, campaign copy, offer suggestions, segment explanations and weekly summaries.
- Ground quantitative claims in verified database queries; label forecasts and estimates.
- Never expose another salon's data or autonomously send campaigns/change prices without authorization.
- Track AI usage and costs per tenant.

4.14 Super-admin console

- Tenant directory, creation and onboarding status.
- Subscription/plan management and usage/billing overview.
- Support tools, integration health and failed background jobs.
- Platform audit logs, user access, feature flags and system health.
- Support access to salon data must be restricted, justified and audited.

5. Multi-tenant architecture and security

Layer	Responsibility
Netlify / Next.js	Owner dashboard, public tenant websites and booking experience.
Railway / FastAPI	Business APIs, session validation, tenant authorization and workflows.
Supabase PostgreSQL	Relational tenant data and transactional records.
Supabase Storage	Logos, gallery images and private documents.
Redis / worker	Reminders, scheduled tasks, notifications and reports.
External providers	Razorpay, Meta WhatsApp Platform, monitoring and analytics.

5.1 Tenant resolution

- Resolve hostname to a published tenant record.
- Load only public branding and data permitted for that website.
- For owner/staff access, validate session and resolve membership server-side.
- Apply tenant restrictions to every business query and audit sensitive changes.

Never trust a salon_id supplied by the frontend as proof of access.

5.2 Core database entities

salons, branches, profiles, salon_memberships, roles, permissions, customers, staff, services, service_categories, appointments, appointment_services, business_hours, time_off, invoices, invoice_items, payments, refunds, products, inventory_transactions, suppliers, memberships, loyalty_transactions, campaigns, message_logs, integrations, subscriptions, audit_logs and salon_usage.

Business records must carry the relevant tenant identifier and, where applicable, branch identifier. Use foreign keys and constraints to prevent cross-tenant references.

5.3 Security controls

- Supabase Auth; server-side role and tenant authorization.
- PostgreSQL RLS for appropriate tables, with tested policies.
- Private storage buckets and tenant-aware access policies.
- Never expose the Supabase service-role key to the browser.
- Encrypt secrets and integration tokens; rotate credentials as needed.
- Rate limiting, abuse protection, audit logs and separate staging/production environments.
- Backups, tested restoration and verified payment webhooks.

6. Recommended technology stack

Layer	Technology	Purpose
Owner dashboard	Next.js + TypeScript	Main web application.
UI	Tailwind CSS + shadcn/ui	Consistent design system.
Frontend hosting	Netlify	Dashboard and public websites.
Backend	FastAPI + Python	Business APIs.
Backend hosting	Railway	API and worker deployment.
Authentication	Supabase Auth	Login, sessions and recovery.
Database	Supabase PostgreSQL	Multi-tenant relational data.
File storage	Supabase Storage	Logos, galleries and documents.
Background jobs	Redis + worker	Reminders and async work.
Payments	Razorpay	Payment links, checkout and webhooks.
Messaging	Meta WhatsApp Business Platform	Salon-owned messaging.
Monitoring	Sentry or equivalent	Error reporting.
Analytics	PostHog or equivalent	Usage and funnel analytics.
Staff app	Flutter, later phase	Native staff experience.

Start as a modular monolith, not microservices. Separate modules in code and introduce more deployment components only when usage justifies them.

7. Subscription and monetization

Plan hypothesis	Monthly price	Positioning
Starter	■699	Small single-location salon.
Growth	■1,499	Automation and stronger reporting.
Pro	■2,999	Advanced operations, AI and growth tools.

These are initial pricing hypotheses, not validated market prices.

- Possible add-ons: extra branches, custom domain, WhatsApp usage, AI credits, premium integrations and priority support.
- Plan limits must be configurable in the super-admin console and enforced by the backend.
- Lifecycle: Trial → Active → Payment Due → Grace Period → Suspended → Cancelled.
- Explain plan limits and post-cancellation data handling. Suspension must not silently delete customer records.

8. Core user journeys

8.1 Salon onboarding

- Owner signs up and verifies account/contact details.
- Creates salon profile and sets timezone.
- Adds logo, colors, services, prices, durations, staff and working hours.
- Configures booking policies and publishes the website.
- Receives booking URL/QR code and completes test booking and checkout.

Success: a salon can accept and manage a real booking without developer assistance.

8.2 Customer booking

- Open salon website; select service, staff preference and available slot.
- Enter contact details and accept applicable policies.
- Pay a deposit if required and receive confirmation.
- View/manage booking according to salon policy.

8.3 Walk-in to checkout

- Receptionist creates walk-in appointment and assigns service/staff.
- Staff completes service; receptionist opens checkout.
- Invoice/payment recorded; eligible stock and commission update.
- Customer history and reports update; receipt is delivered.
- Schedule follow-up if configured.

8.4 Branding update

- Owner edits logo/colors/banner, previews desktop/mobile and publishes.
- Public website displays new branding; other salons remain unaffected.

9. Product roadmap

Phase	Focus	Scope
P1 — MVP	Foundation and daily operations	Auth, tenant isolation, dashboard, salon setup, services, staff, appointments, CRM, basic POS, branded booking website, branding editor, subscription foundations and audit logs.
P2 — Growth	Communication and retention	WhatsApp onboarding, reminders, invoice delivery, inventory, memberships, loyalty, coupons, segments, advanced reports and QR links.
P3 — Intelligence	AI and advanced operations	AI insights, natural-language reporting, campaign suggestions, staff app, custom domains, supplier workflows and branch-aware reporting.
P4 — Scale	Multi-branch and ecosystem	Cross-branch management, optional customer app, advanced controls, deeper analytics, enterprise onboarding and integrations.

10. Non-functional requirements

10.1 Performance

- Responsive dashboard under normal operating conditions.
- Paginate customer, appointment, invoice and audit lists.
- Index tenant IDs and frequently queried date/status fields.
- Optimize images/public assets; move long jobs to background workers.
- Avoid separate expensive queries for every dashboard metric.

10.2 Reliability

- Use database transactions for booking, checkout and inventory workflows.
- Make webhook handlers and background jobs idempotent.
- Retry transient failures safely and display real payment/message state.
- Monitor API health, database capacity, job queues and restore readiness.

10.3 Accessibility and UX

- Responsive desktop/tablet/mobile layouts; keyboard-friendly controls.
- Accessible labels, contrast and focus states; consistent validation.
- Clear loading, success, empty and error states.
- Confirmation before destructive or irreversible actions.

10.4 Data and privacy

- Collect only information needed for the service.
- Provide consent and communication preference controls.
- Define retention/deletion policies and authorized export workflows.
- Limit staff access to sensitive customer information.
- Review applicable Indian privacy and data-protection obligations before launch.

11. Testing and acceptance criteria

11.1 Functional tests

- Owner can configure a salon; staff access is permission-controlled.
- Customers book only available slots; concurrent requests cannot double-book.
- Checkout updates invoices, payments and customer history consistently.
- Inventory changes are recorded; branding affects only the intended tenant.
- Subscription entitlements are enforced server-side.
- Notification failures are visible and retryable.
- Reports reconcile with underlying records.

11.2 Tenant-isolation tests

- Salon A cannot read Salon B's customers or appointments.
- Changing an ID or salon_id in a request does not grant cross-tenant access.
- Public routes expose only approved public data.
- Storage policies do not leak private salon documents.
- Staff cannot access another salon's dashboard.

11.3 Production readiness

- Payment signature verification and duplicate-webhook tests.

- Backup/restore drill; expired-session and revoked-access tests.
- Rate-limit and abuse tests; browser/mobile compatibility.
- Monitoring, alerting and production environment-variable audit.
- No fake business metrics or hardcoded operational records.
- End-to-end booking-to-checkout test; no critical security/data-integrity issues.

12. Success metrics

Metric	Purpose
Time to first published booking page	Onboarding quality.
Time to first completed appointment	Activation.
Bookings completed without manual intervention	Workflow quality.
Booking conflict rate	Scheduling reliability.
Checkout-to-invoice consistency	Financial integrity.
Monthly active salons	Adoption.
Repeat booking rate	Customer retention.
Reminder delivery success	Communication reliability.
Paid salon retention	Product-market fit.
API error rate and latency	Platform health.
Tenant-isolation test pass rate	Security.

Establish baselines with the first salons before setting numeric targets. Do not invent benchmark values.

13. Scaling to 50 salons

- Use one shared PostgreSQL database with suitable indexes and tenant-aware queries.
- Apply and test RLS policies; enforce tenant authorization in the backend.
- Use background workers for scheduled messages and reports.
- Track per-salon usage; apply API rate limits and storage quotas.
- Monitor connection pools, database capacity, error rates and job queues.
- Test backups/restores; reconcile payments and maintain staging/production separation.

A well-designed shared database is preferable to one database per salon at this target scale. Revisit only when measured usage, security or contractual requirements justify it.

14. MVP definition of done

- A salon owner can register and configure a salon.
- Each salon has its own logo, colors, services and branded booking website.
- Owners can create, confirm, reschedule and cancel appointments.
- Availability and booking conflicts are handled correctly.
- Customers can book online.
- Staff and customer permissions are enforced.
- A completed appointment can be checked out and invoiced.
- Customer history and basic reports update correctly.
- Tenant-isolation tests pass.

- Authentication, recovery and session handling are secure.
- Backups, monitoring and error reporting are configured.
- Booking-to-checkout workflows pass end-to-end testing.
- No critical production security or data-integrity issues remain.

15. Final product principle

RUVEXI must feel like each salon has its own professional digital business platform, while the operator maintains one shared SaaS underneath.

The first milestone is a salon owner being able to sign up, publish a branded website, accept a booking, serve the customer, issue the bill and see the result reflected accurately in the business dashboard. This connected workflow is the foundation for every later feature.

Implementation note

This PRD is an implementation baseline, not a substitute for detailed UI wireframes, database migrations, API contracts, threat modeling, legal review or provider-specific integration specifications. Those should be produced and validated during development.
